CONFIGURING FILEVAULT

The University of Southern California's Mobile Technology policy requires that all mobile devices (laptops, tablets, smartphones, etc.) be encrypted. FileVault is the application through which your qualifying device will meet policy requirements, and be protected from data loss.

Complete the steps below to configure FileVault on your device. If you have any questions about this process, contact Dornsife Technology Services.

1. When FileVault is ready to be configured on your workstation, the FileVault Setup screen will display. Click the Enable button.

A password prompt displays.
2. Enter your password in the appropriate field. The password entered should be the same password you use to log into your workstation. After entering your password, select the **Setup** button.

![FileVault Setup](image)

The setup process continues.

3. At this point, you will see one of the following screens displayed. If *FileVault* finished the setup process and successfully synchronized, the following screen is displayed.

![FileVault Enabled](image)

Select the **OK** button. Your workstation will restart.
If FileVault was not able to successfully synchronize, the following screen will display.

Select the OK button. Your workstation will restart.

4. If your setup and synchronization was successful, the process is now complete. If the synchronization process was unsuccessful, you will need to open Managed Software Center, after your workstation finishes restarting. Managed Software Center should be in your dock. Select the dock icon to launch the application.

FileVault is now enabled and synchronized.
