 - E.g., take $L = \mathbb{C}$, or
 - take $L = \mathbb{C}(t_1, \ldots, t_n)$ and think of a family of varieties.
- All algebraic varieties will be assumed smooth, connected, and often proper (read: compact).
- Given an algebraic variety X over L, we write L(X) for its field of rational functions.

・ロン ・回と ・ヨン ・ヨン

Basic definitions: rationality

Definition

An algebraic variety X over L is L-rational if $L(X) \cong L(t_1, \ldots, t_n)$.

・ロン ・回と ・ヨン ・ヨン

Basic definitions: rationality

Definition

An algebraic variety X over L is L-rational if $L(X) \cong L(t_1, \ldots, t_n)$.

• Write \mathbb{P}^n for *n*-dimensional projective space (over *L*), which is the basic example of a rational variety.

イロン イヨン イヨン イヨン

Basic definitions: rationality

Definition

An algebraic variety X over L is L-rational if $L(X) \cong L(t_1, \ldots, t_n)$.

- Write \mathbb{P}^n for *n*-dimensional projective space (over *L*), which is the basic example of a rational variety.
- Think: "most," i.e., a (Zariski) open set, of the solutions to the equations defining X can be rationally parameterized.

・ロト ・日本 ・モート ・モート

Basic question

Question

If $X_d \subset \mathbb{P}^n_{\mathbb{C}}$ is a smooth degree d complex hypersurface, (when) is X_d rational?

・ロン ・回と ・ヨン ・ヨン

æ

Basic example

Example

If $X_2 \subset \mathbb{P}^n_{\mathbb{C}}$, i.e., a quadric, then X_2 is rational.

Aravind Asok (UCLA) Rational connectivity and A¹-connectivity

・ロト ・回ト ・ヨト ・ヨト

Э

Basic example

Example

If $X_2 \subset \mathbb{P}^n_{\mathbb{C}}$, i.e., a quadric, then X_2 is rational. Why? Stereographic projection.

・ロン ・回と ・ヨン・

æ

Basic example

Example

If $X_2 \subset \mathbb{P}^n_{\mathbb{C}}$, i.e., a quadric, then X_2 is rational. Why? Stereographic projection.

Same argument shows any quadric over a field F having an F-rational point is actually F-rational.

Generalizing Step 1: defining higher invariants Generalizing Step 2: constructing an exact sequence Generalizing Step 3: constructing unramified elements

イロト イポト イヨト イヨト

First observations

We'll look at the rationality problem for quadric bundles as above, which we can also think of as quadrics over $\mathbb{C}(t_1, \ldots, t_n)$.

 All "elementary" birational invariants of these higher dimensional quadric bundles are trivial.

Some quick (revisionist) history

Goal: study the kernel of the map $k_n(F) \rightarrow k_n(F(Q_{(a_1,\ldots,a_n)}))$. **Note**: (a_1,\ldots,a_n) determines an element of $k_n(F)$, which we call the associated symbol; easy to show that (a_1,\ldots,a_n) is contained in the kernel.

Example

- n = 1, this was our basic example.
- n = 2, we stated this above (Amitsur + \cdots + Merkurjev).
- n = 3, (Arason '75 + Rost '86/Merkurjev-Suslin '91) proved that the kernel is generated by the symbol.
- *n* = 4, (Jacob-Rost '89 + ...) proved that the kernel is generated by the symbol.
