One of the central “image operations” in forensics, criminology, surveillance, and art history is the Bilderratlas, the structured array of images that allows a comprehensive overview of a situation. This lecture explores the intermediate zone of knowledge that separates the rational use of this technique from certain forms of madness with examples from spy thrillers, science fiction, and art historical practices inspired by the iconology of Aby Warburg.

This conference has been made possible thanks to funding from the Social Science Research Council’s Dissertation Proposal Development Fellowship, the USC Dornsife College of Letters, Arts and Sciences, and the USC Visual Studies Research Institute.
