Ph.D. in Computational Biology and Bioinformatics
University of Southern California
Los Angeles, CA

The University of Southern California (USC) is an international leading institution in Computational Biology and Bioinformatics for more than 35 years. Since Michael Waterman joined USC in 1982, the group has grown to include a large number of core and affiliated faculty members with Nobel and Dan David prize laureates and members of US National Academies of Sciences and Engineering. The program has more than 50 doctoral students and postdoctoral associates. Our research is supported by grants from the National Institutes of Health (NIH) and the National Science Foundation (NSF), as well as private foundations. From 2003 to 2015, we were awarded Center of Excellence in Genome Science grants by NIH.

Students in our program may choose from a broad set of research topics, with the following areas receiving particular emphasis:

- Computational structural biology
- Quantitative genetics and evolutionary biology
- Genomics, epigenomics and metagenomics
- Molecular dynamics, networks, and Systems biology
- Big data and precision medicine
- Neuro and molecular imaging
- Sequence analysis, genome assembly and mapping

Our graduates have an exceptional placement rate, with some opting for highly desirable industry positions, and others continuing successfully in academia and research. Southern California is one of the premier cultural hubs in the country, and we have nearly perfect weather year-round.

We hope you will consider applying to our Ph.D. program!
